

Dear Participants,

The following applications (depending on your operating system) are recommended to practice the command line lessons. You can install/configure it in advance and try the examples alongside the workshop or at your convenient time.

### **1. Windows**

If you are using Windows operating system, I suggest you install Git Bash software prior. Please go to <https://git-scm.com/downloads> and download and install the Windows version of the executable. Leave the default options as it is. The following article shows step-by-step instructions with screenshots on how to install it. <https://www.stanleyulili.com/git/how-to-install-git-bash-on-windows/>

### **2. Linux/Mac**

If you are using a version of (e. g. Ubuntu), you can use the terminal application available within Linux. You can launch the terminal in Ubuntu by pressing the Control, ALT, and T keys together. Or you can open it by going to the applications and typing terminal, and click it. In Mac also, the terminal application is available inbuilt.

Thanks,  
Sajil
